

Systems Thinking in Communities:

Understanding the Causes of Inactivity, Poor Diet/Nutrition, and Childhood Obesity in Jacksonville, Florida

This community storybook was developed by Transtria LLC.

Support was provided by the Robert Wood Johnson Foundation.

Acknowledgments

Support for this evaluation was provided by a grant from the Robert Wood Johnson Foundation (#67099). Transtria LLC led the evaluation and dissemination activities from April 2009 to March 2014. Representatives from the Healthy Kids, Healthy Jacksonville partnership actively participated in the evaluation planning, implementation, and dissemination activities.

We are grateful for the collaboration with and support from the Robert Wood Johnson Foundation (Laura Leviton, PhD and Tina Kauh, PhD), the Washington University Institute for Public Health (Ross Brownson, PhD), the Healthy Kids, Healthy Communities (HKHC) National Program Office (Casey Allred; Rich Bell, MCP; Phil Bors, MPH; Mark Dessauer, MA; Fay Gibson, MSW; Joanne Lee, LDN, RD, MPH; Mary Beth Powell, MPH; Tim Schwantes, MPH, MSW; Sarah Strunk, MHA; and Risa Wilkerson, MA), the HKHC Evaluation Advisory Group (Geni Eng, DrPH, MPH; Leah Ersoylu, PhD; Laura Kettel Khan, PhD; Vikki Lassiter, MS; Barbara Leonard, MPH; Amelie Ramirez, DrPH, MPH; James Sallis, PhD; and Mary Story, PhD), the Social System Design Lab at Washington University in St. Louis (Peter Hovmand, PhD), the University of Memphis (Daniel Gentry, PhD), and Innovative Graphic Services (Joseph Karolczak).

Special thanks to the many individuals who have contributed to these efforts from Transtria LLC, including Evaluation Officers (Tammy Behlmann, MPH; Kate Donaldson, MPH; Cheryl Carnoske, MPH; Carl Filler, MSW; Peter Holtgrave, MPH, MA; Christy Hoehner, PhD, MPH; Allison Kemner, MPH; Jessica Stachecki, MSW, MBA), Project Assistants (James Bernhardt; Rebecca Bradley; Ashley Crain, MPH; Emily Herrington, MPH; Ashley Farell, MPH; Amy Krieg; Brandye Mazdra, MPH; Kathy Mora, PhD; Jason Roche, MPH; Carrie Rogers, MPH; Shaina Sowles, MPH; Muniru Sumbeida, MPH, MSW; Caroline Swift, MPH; Gauri Wadhwa, MPH; Jocelyn Wagman, MPH), additional staff (Michele Bildner, MPH, CHES; Daedra Lohr, MS; Melissa Swank, MPH), Interns (Christine Beam, MPH; Skye Buckner-Petty, MPH; Maggie Fairchild, MPH; Mackenzie Ray, MPH; Lauren Spaeth, MS), Transcriptionists (Sheri Joyce; Chad Lyles; Robert Morales; Vanisa Verma, MPH), and Editors (Joanna Bender and Julie Claus, MPH).

Introduction

Healthy Kids, Healthy Jacksonville is one of 49 community partnerships participating in the national *Healthy Kids, Healthy Communities* program of the Robert Wood Johnson Foundation (www.healthykidshealthycommunities.org). The purpose of this *Healthy Kids, Healthy Jacksonville* project was to introduce systems thinking at the community level by identifying the essential parts of the Jacksonville, Florida system and how the system influences policy and environmental changes to promote healthy eating and active living as well as to prevent childhood obesity. To accomplish this goal, community partners participated in a group model building session and discussions. The group model building exercises were designed by staff from Transtria LLC and the Social System Design Lab at Washington University in St. Louis, Missouri as part of the *Evaluation of Healthy Kids, Healthy Communities* funded by the Robert Wood Johnson Foundation. These exercises actively involved a wide range of participants in modeling complex systems and provided a way for different representatives (e.g., government agencies, community-based organizations, businesses) to better understand the systems (i.e., dynamics and structures) in the community (see the *Healthy Kids, Healthy Communities Group Model Building Facilitation Handbook*, www.transtria.com/hkhc). Overall, the evaluation was designed to assess policy, system, and environmental changes as a result of the community partnerships' efforts to increase healthy eating and active living in order to reduce childhood obesity.

Jacksonville, Florida: Background and Local Participation

The Healthy Jacksonville Childhood Obesity Prevention Coalition was established in 2001 as one of the Community Coalitions of Healthy Jacksonville, a Duval County Health Department initiative. Healthy Kids, Healthy Jacksonville (HKHJ) operated under the Healthy Jacksonville Childhood Obesity Coalition and focused its efforts on food access, joint use, and active transportation.

The partnership established a steering committee to prioritize workplan strategies and provide direction to the overall partnership. The partnership met regularly and organized into workgroups for each major goal of the HKHJ workplan (i.e., Food Policy Council Workgroup, Built Environment Workgroup, Joint Use Workgroup, Communications Workgroup).

The quarterly partnership meetings had an average of 50-60 people in attendance (see Appendix C for a list of partners). Partnership membership and involvement was consistent throughout the project by organizations and community residents. There was strong community support and participation in HKHJ. The Food Policy Council and Context Sensitive Streets efforts were led entirely by partners and key stakeholders. The HKHJ staff provided support for meetings and communication.

***Healthy Kids, Healthy Jacksonville's* Priorities and Strategies**

The partnership and capacity building strategies of *Healthy Kids, Healthy Jacksonville* included:

- **Food Policy Council:** HKHJ created a Duval County Food Policy Council to advocate for healthy food policies in Duval County and across the state. The Food Policy Council hosted annual Food Policy Summits to address food access and healthy eating policies.

The healthy eating and active living strategies of *Healthy Kids, Healthy Jacksonville* included:

- **Joint Use:** HKHJ partnered with City of Jacksonville Parks and Recreation and the Duval County Public School System to increase school and community resident awareness and utilization of the existing Duval County Public School System joint use policy.
- **Active Transportation:** HKHJ, partners, and community residents provided recommendations and support for the City of Jacksonville's 2030 Mobility Plan and the implementation of Context Sensitive Streets guidelines throughout the city.
- **Access to Healthy Food:** HKHC partnered with Friends of Northeast Florida Gardens and community garden partners to support the implementation and expansion of gardens throughout Duval County. HKHJ partnered with area youth and the Jacksonville Farmers' Market to conduct a "So Fresh, So Clean" media campaign and recruit Health Zone 1 corner stores to sell fresh produce. The partnership worked to increase Supplemental Nutrition Assistance Program and Electronic Benefit Transfer (SNAP/EBT) payments at area farmers' markets. Farmers' market efforts are ongoing.

For more information on the partnership, please refer to the Jacksonville case report (www.transtria.com/hkhc).

Systems Thinking in Communities: Jacksonville, Florida

“Systems thinking” represents a range of methods, tools, and approaches for observing the behaviors of a system (e.g., family, community, organization) and how these behaviors change over time; changes may occur in the past, present, or future.

Figure 1 illustrates a system of policies, environments, local collaborations, and social determinants in Jacksonville, Florida that influence healthy eating, active living, and, ultimately, childhood obesity. This system and the dynamics within the system are complicated with many different elements interacting.

Models, such as Figure 1, provide a way to visualize all the elements of the system and their interactions, with a focus on causal relationships as opposed to associations. Through the model, specific types of causal relationships, or feedback loops, underlying the behavior of the dynamic system, can be identified to provide insights into what is working or not working in the system to support the intended outcomes (in this case, increases in healthy eating and active living, and decreases in childhood overweight and obesity). In system dynamics, the goal is to identify and understand the system feedback loops, or the cause-effect relationships that form a circuit where the effects “feed back” to influence the causes.

Group Model Building

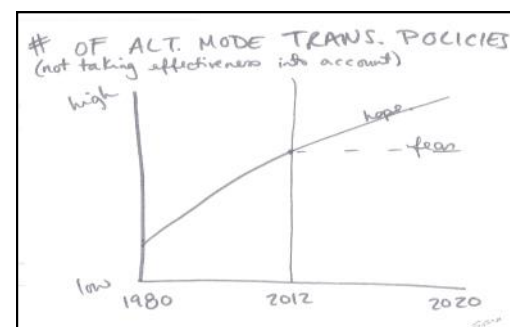

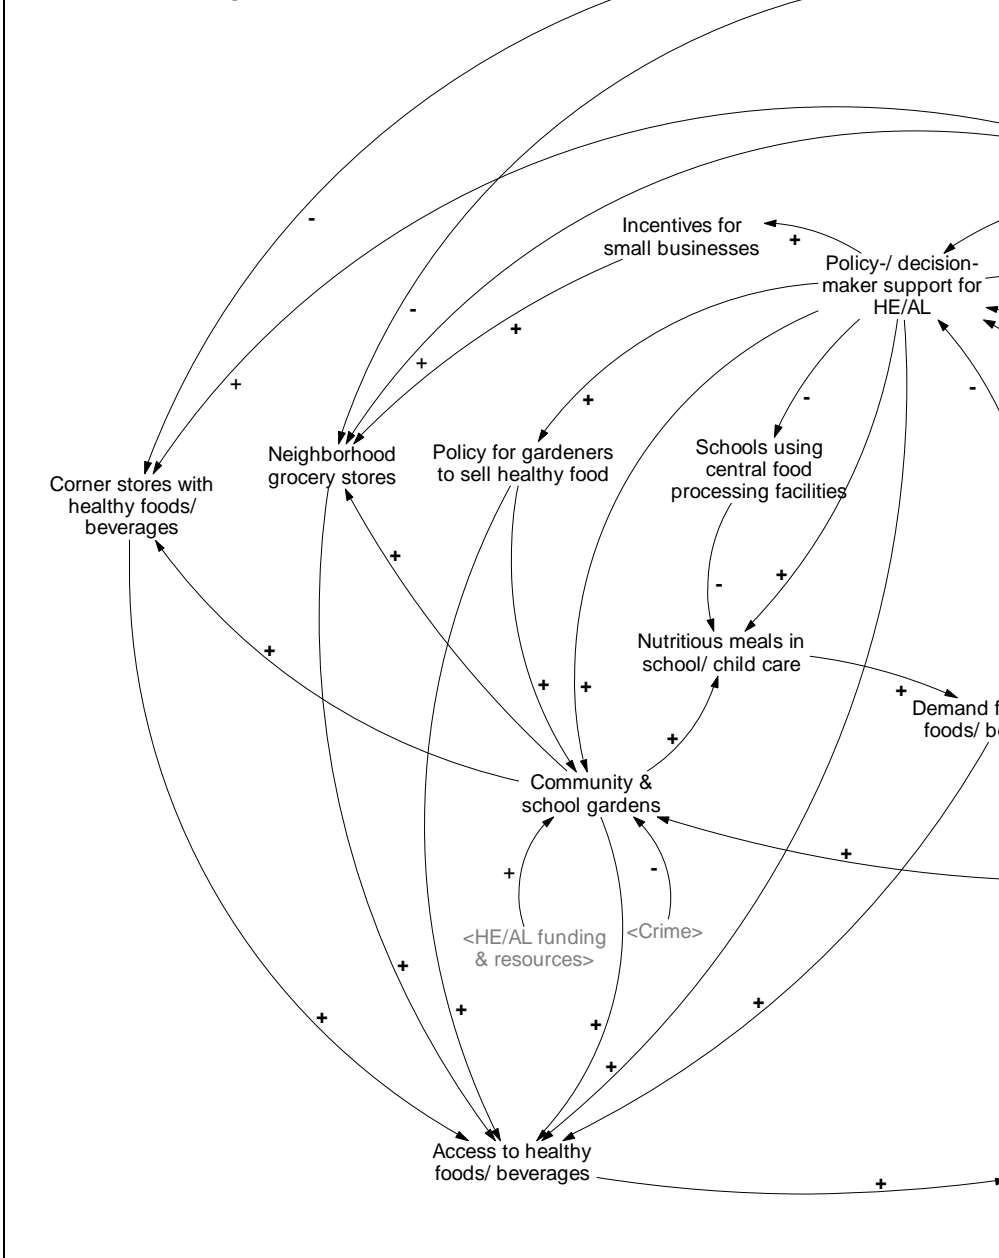

Members of the *Healthy Kids, Healthy Jacksonville* partnership participated in a group model building session in December, 2012 and generated this system. also referred to as a causal loop diagram (Figure 1). Participants in the group model building session included representatives from government agencies, community-based organizations, businesses. The

group model building session had two primary activities: 1) a Behavior Over Time Graph exercise; and 2) a Causal Loop Diagram (or structural elicitation) exercise.

Behavior Over Time Graphs

To identify the range of things that affect or are affected by policy, system, and environmental changes in Jacksonville related to healthy eating, active living, and childhood obesity, participants designed graphs to name the influences and to illustrate how the influences have changed over time (past, present, and future). In this illustration for policies supporting alternative modes of transportation, the number of these policies has increased since 1980 and the participant hopes that this increase will continue in the future.

Figure 1: *Healthy Kids, Healthy Jacksonville* Causal Loop Diagram

Causal Loop Diagram for the Childhood Obesity System

The causal loop diagram (CLD) represents a holistic system and several subsystems interacting in Jacksonville, Florida. In order to digest the depth and complexity of the diagram, it is helpful to examine the CLD in terms of the subsystems of influence.

Because of this project's focus on healthy eating, active living, and childhood obesity, this system draws attention to a number of corresponding subsystems, including: healthy eating policies and environments (red), active living policies and environments (blue), health and health behaviors (orange), partnership and community capacity (purple), and social determinants (green).

From the group model building exercises, several variables and causal relationships illustrated in Figure 2 were identified within and across subsystems. This section describes the subsystems in the CLD.

Healthy Eating Policies and Environments (Red)

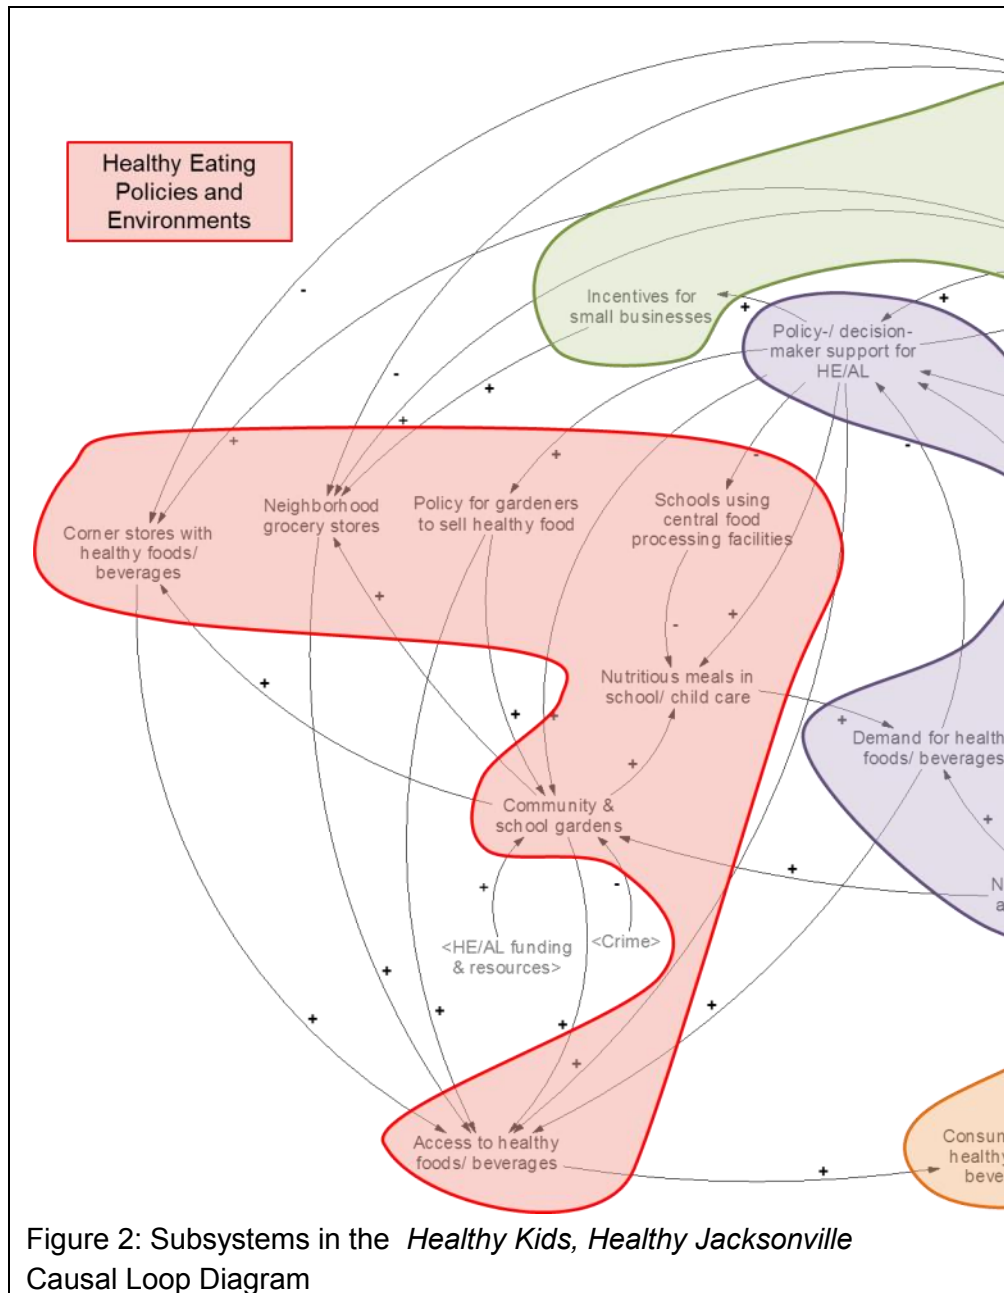

The healthy eating policy and environmental subsystem includes food production, food distribution and procurement, and food retail. During the behavior over time graphs exercise, the participants generated ten graphs related to policy or environmental strategies (e.g., community and school gardens) or contexts (e.g., neighborhood grocery stores) that affected or were affected by the work of *Healthy Kids, Healthy Jacksonville*. The variables represent participants' conversations from the behavior over time graph and causal loop diagram exercises.

Active Living Policies and Environments (Blue)

The active living policy and environmental subsystem includes design, planning, construction, and enforcement or maintenance related to access to opportunities for active transportation and recreation. For this topic, the group model building participants developed six graphs related to policy or environmental strategies (e.g., pedestrian and bike infrastructure) or contexts (e.g., access to parks and recreation facilities) that affected or were affected by the partnership's work.

Health and Health Behaviors (Orange)

The subsystem for health and health behaviors includes health outcomes (e.g., obesity), health behaviors (e.g., healthy eating, physical activity), and behavioral proxies or context-specific behaviors (e.g., use of parks and recreation facilities, active transportation).

Partnership and Community Capacity

The partnership and community capacity subsystem refers to the ways communities organized and rallied for changes to the healthy eating and active living subsystems. For instance, *Healthy Kids, Healthy Jacksonville*

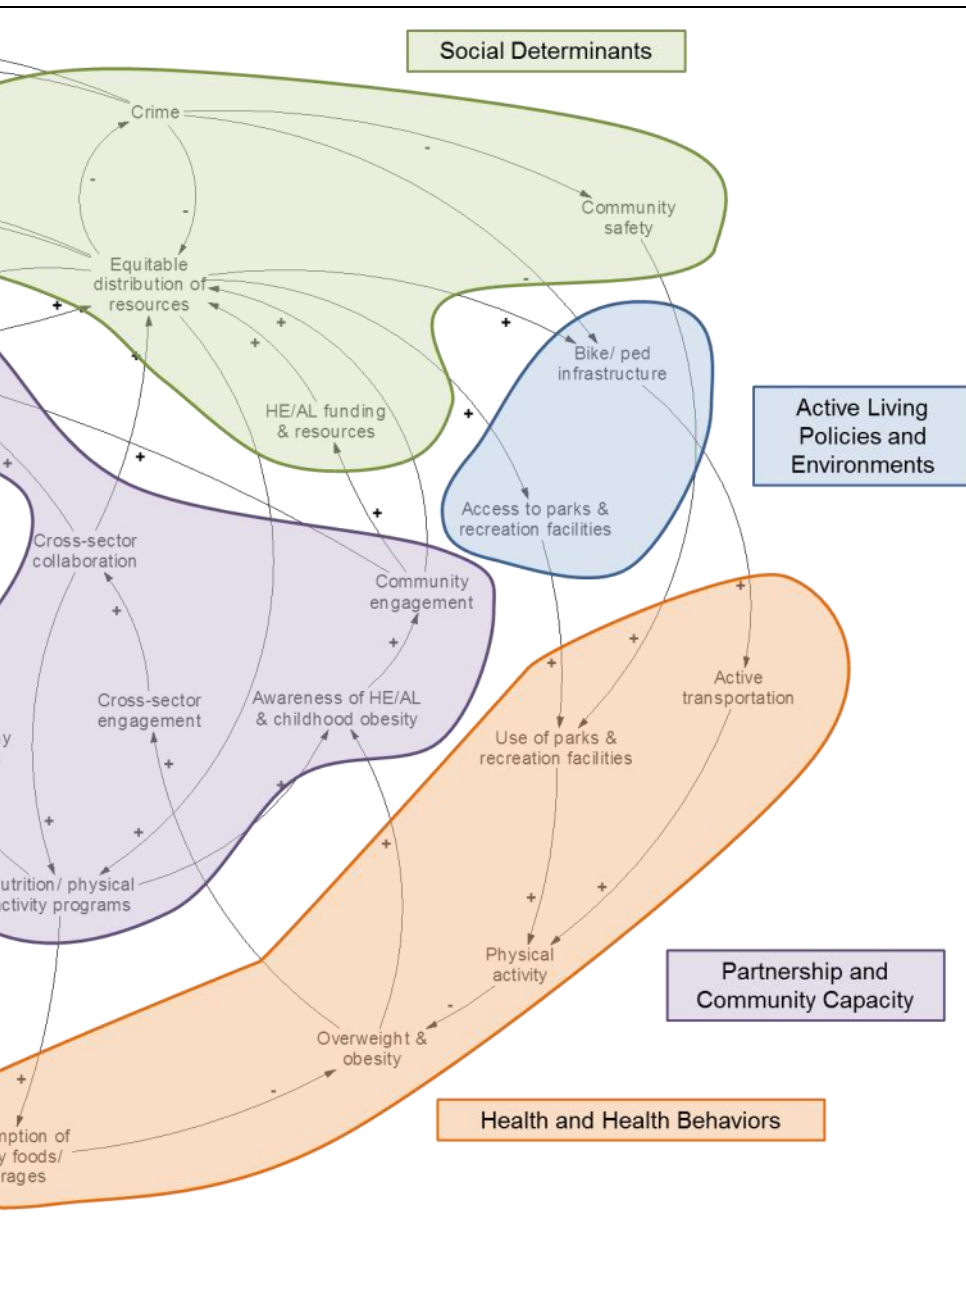

worked to increase cross-sector collaboration and engagement through a food policy council. This subsystem also includes community factors outside the partnership that may influence or be influenced by their efforts, such as policy- or decision-maker support for healthy eating and active living.

Social Determinants

Finally, the social determinants subsystem denotes societal conditions (e.g., equitable distribution of resources) and psychosocial influences (e.g., perceptions of community safety) in the community that impact health beyond the healthy eating and active living subsystems. In order to achieve health equity, populations and subgroups within the community must have equitable access to these resources and services.

Each one of these subsystems has many more variables, causal relationships (arrows), and feedback loops that can be explored in greater depth by the *Healthy Kids, Healthy Jacksonville* partners or by other representatives in Jacksonville, Florida. Using this CLD as a starting place, community conversations about different theories of change within subsystems may continue to take place.

The next sections begin to examine the feedback loops central to the work of *Healthy Kids, Healthy Jacksonville*. In

these sections, causal relationships and notations (i.e., arrows, "+" signs, "-" signs) from Figure 2 will be described to increase understanding about how systems thinking and modeling tools can work in communities to increase understanding of complex problems that are continuously changing over time, such as childhood obesity. At the end of this CLD storybook, references to other resources will be provided for those interested in more advanced systems science methods and analytic approaches.

In a balancing loop, the effect of the variables tend to create more of a stable trend over time, as opposed to one that is continually increasing or decreasing. This effect continues through the cycle and returns a stabilizing influence to the

original variable, respectively.

Looking specifically at the "+" or "-" notation, a feedback

loop that has an odd number of "-" signs, or polarities in the loop, is considered a balancing loop. Reinforcing loops, with zero or an even number of "-" signs, are another type of feedback loop.

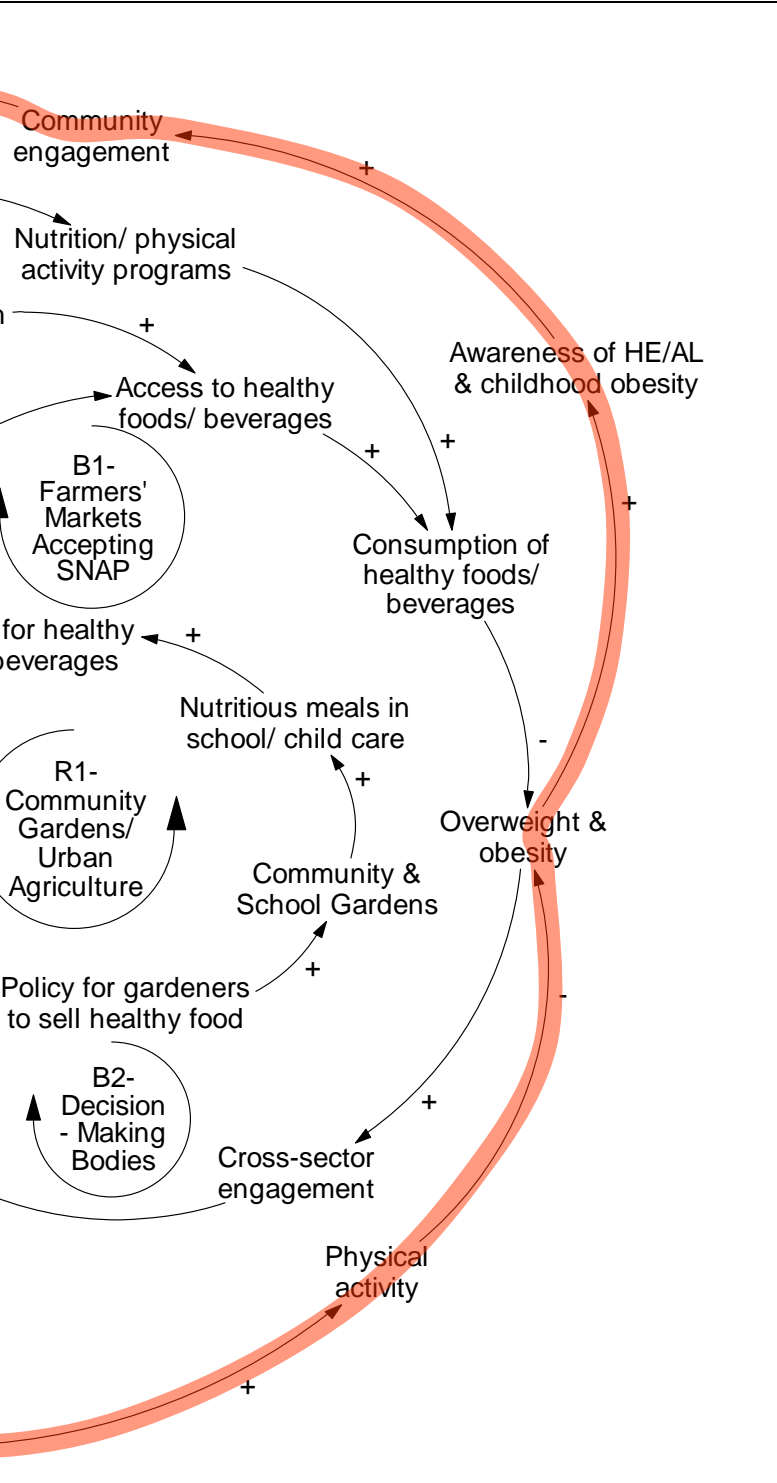

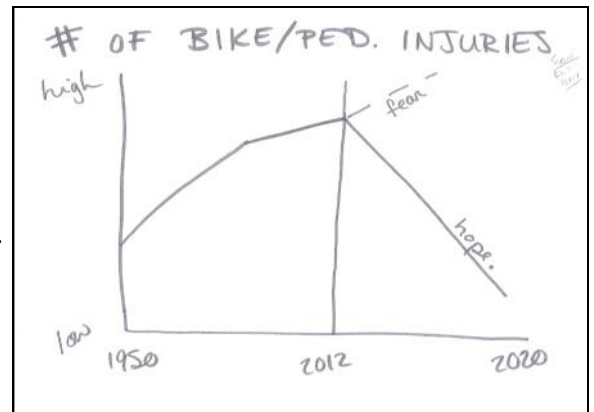

In isolation, this balancing loop represents the influence of bike and pedestrian infrastructure on physical activity on overweight and obesity. To understand other influences on these variables, it is important to remember that this reinforcing loop is only one part of the larger CLD (see Figures 1 and 2), and the other loops and causal relationships can have an impact on the variables in this loop.

System Insights for Healthy Kids, Healthy Jacksonville

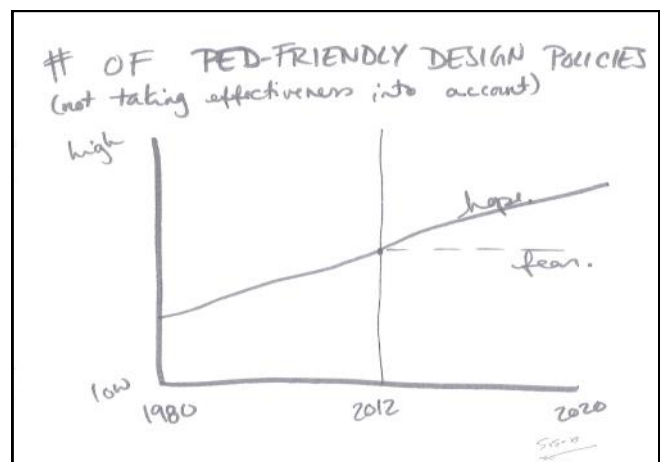

Participants also identified an increase in the number of bike and pedestrian injuries in Jacksonville, Florida since 1950 (see above behavior over time graph). Yet, since 1980, there has been an increase in pedestrian-friendly design policies (see below behavior over time graph).

From the systems thinking exercises, several insights can inform the partners' continued efforts to increase active transportation. For instance, safe, quality bike and pedestrian infrastructure can reduce injuries in addition to increasing physical activity in residents.

In addition to these insights, systems thinking can also help to pose key questions for assessment and evaluation, including methods and measures for

assessing equitable distribution of bike and pedestrian infrastructure and pedestrian-friendly design policies.

Opportunities for Systems Thinking in Jacksonville, Florida

This storybook provided an introduction to some basic concepts and methods for systems thinking at the community level, including: causal loop diagrams, variables, causal relationships and polarities, reinforcing feedback loops, and balancing feedback loops, among others. For the *Healthy Kids, Healthy Jacksonville* partners, this storybook also summarized the healthy eating, active living, partnership and community capacity, social determinants, and health and health behaviors subsystems in the Jacksonville causal loop diagram as well as an example feedback loop corresponding to the partnership's primary strategies.

This causal loop diagram reflects a series of conversations among partners and residents from 2011 to 2013. Some discussions probed more deeply into different variables through the behavior over time graphs exercise, or causal relationships through the causal loop diagram exercise.

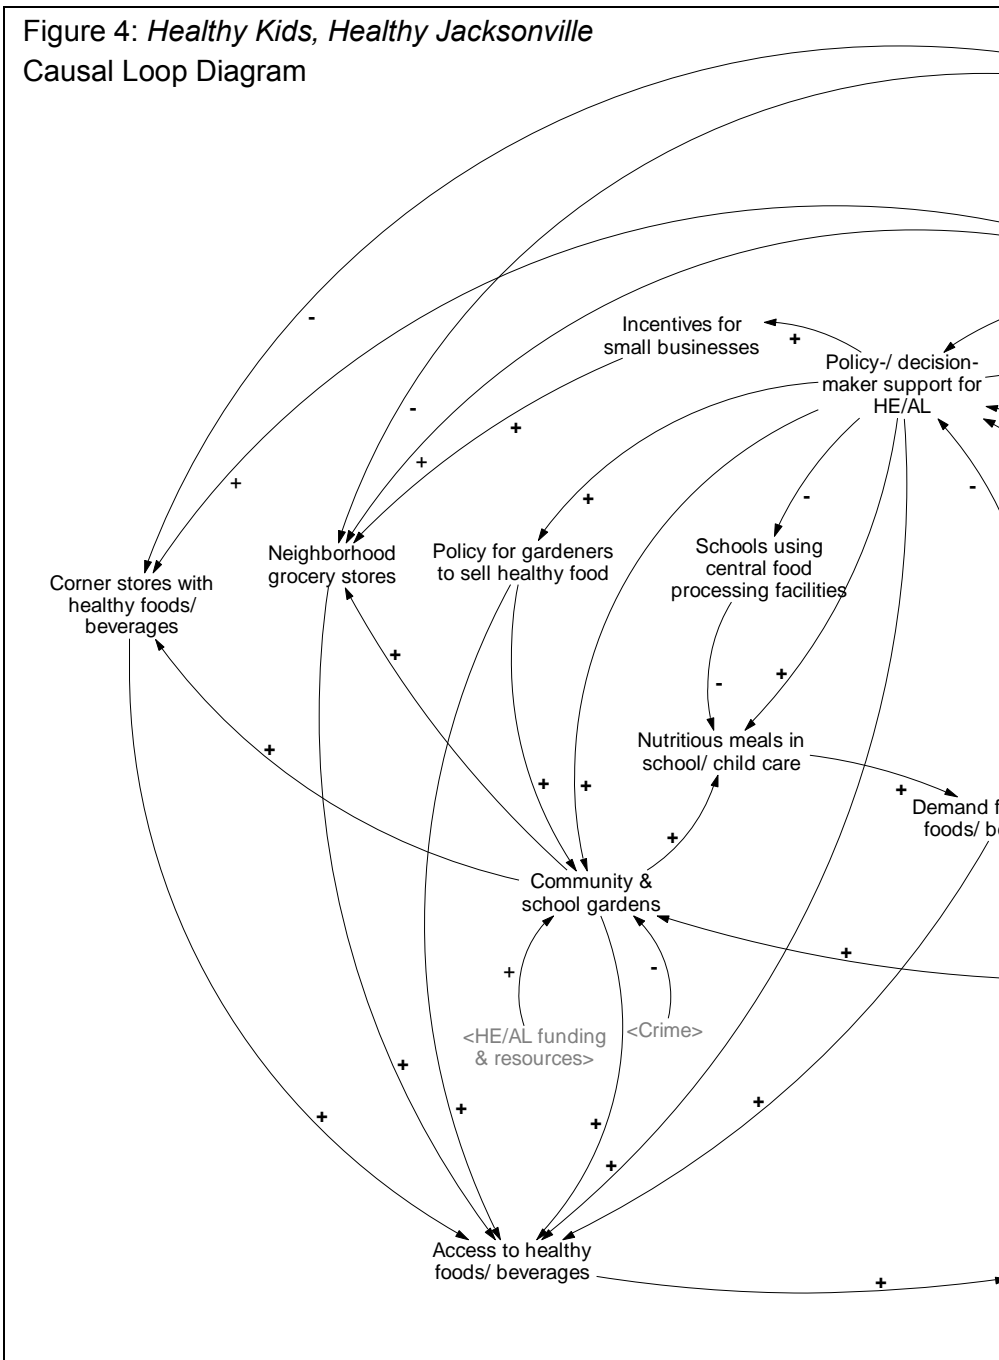

This represented a first attempt to collectively examine the range of things that affect or are affected by policy, system, and environmental changes in Jacksonville, Florida to promote healthy eating and active living as well as preventing childhood overweight and obesity.

Yet, there are several limitations to this storybook, including:

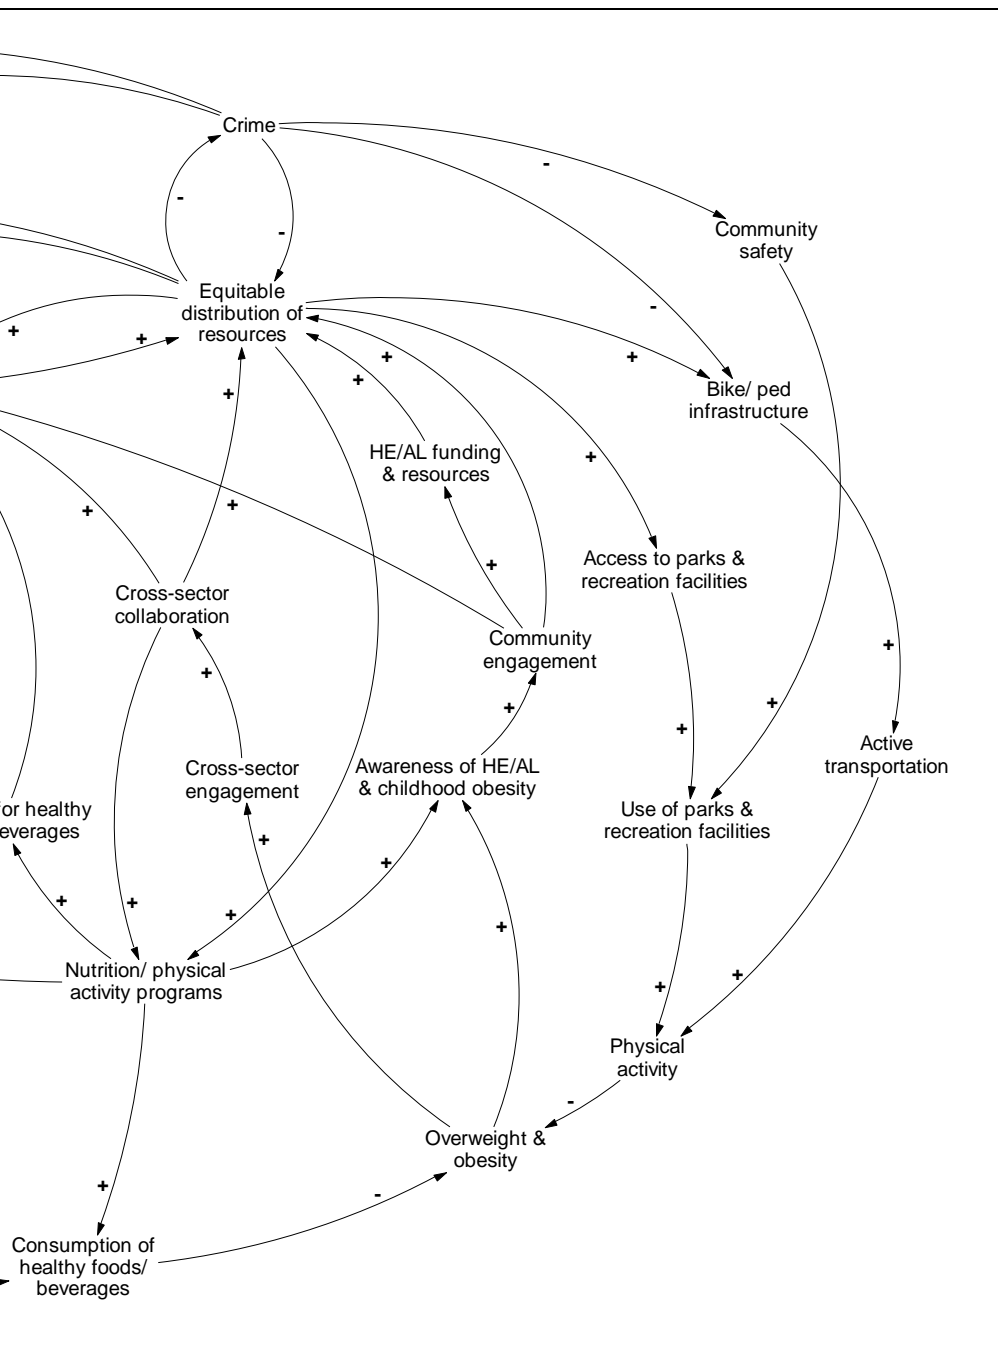

- the participants represent a sample of the *Healthy Kids, Healthy Jacksonville* partners (organizations and residents) as opposed to a representative snapshot of government agencies, community organizations, businesses, and community residents;
- the behavior over time graphs and the causal loop diagram represent perceptions of the participants in these exercises (similar to a survey or an interview representing perceptions of the respondents);
- the exercises and associated dialogue took place in brief one- to two-hour sessions, compromising the group's capacity to spend too much time on any one variable, relationship, or feedback loop; and
- the responses represent a moment in time so the underlying structure of the diagram and the types of feedback represented may reflect "hot button" issues of the time.

Much work is yet to be done to ensure that this causal loop diagram is accurate and comprehensive, for example:

Figure 4: *Healthy Kids, Healthy Jacksonville* Causal Loop Diagram

- having conversations to discuss existing feedback loops to ensure that the appropriate variables and relationships are represented accurately;
- reviewing the behavior over time graphs (see also Appendix E) to confirm that the trends reflect common perceptions among residents and compare these trends to actual data;

- revisiting variables removed because they were not part of feedback loops, including corporate food retail, artificial additives & GMOs in foods/beverages, affordability of health foods/beverages, nutritional education/counseling (school, health care), language/cultural barriers, suburban sprawl, physical education in school, share the road education, racial discrimination, policies for public transportation & bike/ped infrastructure, mental/emotional health, academic performance, bike/ped injuries, schools in neighborhoods, poverty, connectivity of alternative transportation modes, access to sugar-sweetened beverages, fast food restaurants, demand for fast food; and
- starting new conversations about other variables (behavior over time graphs exercise) or relationships (causal loop diagram exercise) to add to this diagram.

In addition, different subgroups in Jacksonville may use this causal loop diagram to delve in deeper into some of the subsectors (e.g., healthy eating, active living) or feedback loops, creating new, more focused causal loop diagrams with more specific variables and causal relationships.

Use of more advanced systems science methods and analytic approaches to create computer simulation models is another way to take this early work to the next level.

The references section includes citations for resources on these methods and analytic approaches, and it is necessary to engage professional systems scientists in these activities.
